

Authentication & Security – Project Summary

1. User Registration System

- User name, email aur password se register karta hai.
- Password ko bcrypt se hash karke database me store kiya jata hai.
- Same email se dobara registration allowed nahi hai.

2. Secure Login System

- User email aur password se login karta hai.
- Password comparison hashed password ke sath hota hai.
- Galat details par access deny hota hai.

3. JWT Token Based Authentication

- Login ke baad JWT token generate hota hai.
- Token me user id aur email hota hai.
- Token ka use protected routes access karne ke liye hota hai.

4. Auth Middleware

- Har protected request me token verify karta hai.
- Valid token par request allow hoti hai.
- Invalid ya missing token par 401 Unauthorized response milta hai.

5. Protected Routes

- Register aur login routes public hain.
- Appointment aur user detail routes protected hain.

6. Environment Variables

- MongoDB URI, JWT Secret jaise sensitive data .env file me rakhe gaye hain.
- .env file GitHub par upload nahi hoti.

7. MongoDB Atlas Security

- Cloud database use kiya gaya hai.
- IP whitelist aur database user authentication enable hai.

8. GitHub Security Practice

- .gitignore file use karke node_modules aur .env ignore kiya gaya.
- Clean aur secure repository maintain ki gayi.

Short Summary:

Maine Node.js aur Express ka use karke JWT based secure authentication system banaya jisme password hashing, token based authorization, middleware protection aur environment security best practices follow ki gayi hain.
